Abstract of DE4438736

To produce articles with an improved gripping surface, such as glass containers like bottles, a coating is applied (7,8,2) to give a roughened surface. The coating contains mineral granular material as well as a bonding agent. Pref., the bonding agent is augmented by a solvent for working, to give it a liquid or tacky quality. The coating is applied as separate layers of a bonding agent and the granular material. The bonding agent is applied by spraying (7) or a brush, or the object is immersed in the bonding agent.
